

Advanced Task 2-3 External Interrupt vs Polling

🎯 Demo goal

Build on Basic Task 2-3 by adding a second button + LED pair (Button B + LED B).

- **Button A + LED A:** keep using external interrupt to control the LED state
- **Button B + LED B:** use polling instead —
 - Continuously check Button B's state and detect press transitions (edge detection)
 - Toggle LED B when a press is detected
 - Add “`delay(2000)`” at the end of “`void loop()`” to simulate a busy/blocking system

❓ Why?

- What is polling? What are the differences between external interrupt and polling?
- Which method do you prefer to use for developing a robotic system?
