

Advanced Task 3-1 Timer Interrupt vs Blocking Delay

Refer to Basic Task 1-2 and build two button + LED pairs

Button A + LED A

Timer Interrupt (TimerOne)

- TimerOne library sets up a periodic interrupt every 50ms
- Read Button A's state and update LED A inside the ISR

Button B + LED B

Blocking Delay

- Read Button B's state and update LED B every loop
- Insert a 1 second at the end of “ `void loop()` ” function.

Demonstrate & explain to the TA

- What is a timer interrupt? What are the differences between the two methods in this task?
- Which method do you prefer to use for developing a robotic system?
